MALDI-TOF Matrix Assisted Laser Desorption Ionization Time-of-Flight

MS Mass Spectrometry

1 Background and Objectives

Bacterial taxonomy is still a challenging domain (Godfray, H.C.J., 2002. Challenges for taxonomy; *Nature*, 417(6884), 17-19. Cohan, F., 2002. What are bacterial species? *Annual Review of Microbiology*, 56, 457-487). During the last decade MALDI-TOF MS has found increasing application in clinical diagnosis and systematics and appears to be of great promise for quality assurance and research purposes in resource centres. The first attempt to use mass spectrometry to identify bacteria was proposed in 1975 (Anhalt & Fenselau, 1975). At the beginning, the targeted molecules were very small (<300D) or between 600 and 1000D for bacterial polar lipids, and the analysis was most often applied to lysed bacteria. **The idea to target the bacterial proteins and to use whole cells by applying a MALDI source started only in years 1995-1995 with in particular the paper of Holland et al. 1996.** Since that time, many attempts were made to identify gram negative or gram positive bacteria, highlighting the importance of sample preparation, and of reproducibility of spectra. **An exhaustive bibliography of this subject since that date is presented in a specific section below.** All papers underlined the great potential of MALDI-TOF in terms of bacterial identification, even sometimes on sub species and strain differentiation.

In order to support the introduction of this fast and reliable identification method in European culture collections, deliverable D15.33 of sub-task JRA2.1.3 was dedicated to the creation of a public MALDI-TOF MS database of bacterial protein patterns for reference and identification purposes.

2 Methods

2.1 Strains

After internal quality control, a total of 1150 profiles have been made publicly available for download. The spectra represent strains of the suborder *Micrococcineae* (172) and the following genera and families: *Acetobacter* (22), *Aeromonas* (71), *Carnobacterium* (26), *Lactobacillus* (491), *Lactococcus* (9), *Leuconostocaceae* (108), *Pediococcus* (18), *Propionibacterium* (14), *Pseudomonas* (142) and *Vibrionaceae* (77).

These species were chosen because either for their technological interest or for the daily challenge to identify them correctly.

See annex 1 of this document for the detailed list of strains.

Strains were recovered and cultivated using the medium and incubation conditions recommended in the respective on-line catalogues (www.ect.org, www.dsmz.de, www.crbip.pasteur.fr, www.belspo.be). The biomass was collected from agar plates.

2.2 Sample preparation

Sample preparation for MALDI-TOF MS was carried out according to the ethanol/formic acid extraction protocol recommended by Bruker Daltonics (<http://www.bdal.de>): ca. 10 mg biomass (5-10 mg for CIP) from agar cultures was first suspended in 300 µl water by careful mixing. Then the suspension was mixed with 900 µl ethanol. The biomass was collected by centrifugation and the pellet was re-suspended in 50 µl 70% formic acid. The suspension was mixed carefully with 50 µl acetonitrile (ACN). Immediately after centrifugation the supernatant was removed and aliquots of 1-1.5 µl were placed on each spot of a stainless-steel target plate. After air-drying 1-2 µl matrix solution (saturated solution of α -cyano-4-hydroxycinnamic acid in 50% aqueous ACN containing 2.5% trifluoroacetic acid) is added.

2.3 Instrumentation

The spectra were recorded with different models of mass spectrometers: Reflex IV (Bruker Daltonics), Autoflex speed (Bruker Daltonics) and Microflex L20 (Bruker Daltonics) respectively for CECT, CIP and DSMZ. Spectra of LMG strains were recorded at DSMZ by using cell extracts obtained from LMG.

The instruments are equipped with a N₂ laser. All spectra were recorded in linear, positive mode. The acceleration voltage was 20 kV. Spectra were collected as a sum of 250 (240 for CECT) shots across a spot. A mass range of 2,000-20,000 *m/z* was used for analysis.

The following ribosomal proteins of *E. coli* DSM 498 (=ATCC 23716 = IMG 1711; K-12 wildtype) were used for calibration: RL36 4364.33 Da; RS32 5095.82 Da; RS34 5380.39 Da; RS33m 6254.39 Da; RL32 6315.19 Da; RL30 6410.60 Da; RL35 7157.74 Da; RL29 7273.45 Da; RS21 8368.76 Da; RS15 10137.57 Da; RS19 10299.09 Da.

2.4 Spectra

The vast majority of profiles were represented by 12 to 16 spectra (repetitions).

The Flexanalysis software (Bruker Daltonics) was used for baseline subtraction, smoothing of spectra and mass labelling of peaks. Spectra with maximal peak intensities of 2000 or less were deleted.

3 Access to the database of MALDI-TOF mass spectra of bacteria

3.1 Terms of usage

Users of the database are requested to acknowledge the project that enabled the built of the public database: The research leading to these results has received funding from the European Community's Seventh Framework Programme (FP7, 2007-2013), Research Infrastructures action, under the grant agreement No. FP7-228310 (EMbaRC project).

3.2 Download of mass spectra

The database of MALDI-TOF mass spectra of bacterial strains is hosted by the FTP-server of UVEG-CECT. The database can be downloaded in full or in part (per taxonomic groups) after requesting a username and password by writing to the email address maldi_embarc@cect.org.

The user obtains an attached list displaying the database content and the necessary login and download information by the following email message:

"Dear user,

Thank you for your interest in the EMbaRC MALDI-TOF mass spectra database.

The database is organized into folders per taxonomic groups: one suborder (*Micrococcineae*), two families (*Leuconostocaceae* and *Vibrionaceae*), and eight genera (*Acetobacter*, *Aeromonas*, *Carnobacterium*, *Lactobacillus*, *Lactococcus*, *Pediococcus*, *Propionibacterium* and *Pseudomonas*). The number of spectra and the coverage they represent within each group is variable (you may check it at the excel file attached).

In order to reduce the time for downloading, all folders are compressed to rar-files.

To access the ftp server follow the link <ftp://cect.uv.es/>

Alternatively you may copy and paste it into your web browser or your file browser.

Username: XxXxX

Password: XxXxX

(Note that both are case sensitive)

Once saved in your computer you can mix spectra from different folders at your convenience or delete the ones you do not need.

As far as we are aware, the spectra are only compatible with the analysis software Biotyper (Bruker Daltonics).

Yours sincerely,

....

After download of the spectra to the computer the user needs the appropriate software (Biolyper, Bruker) for handling and analysing the profiles.

4 Conclusion

The database of MALDI-TOF mass spectra of bacteria was created in two periods of Subtask JRA 2.1.3.: The first period was dedicated to the strain authentication and identification of accurate and misclassified / mislabeled strains in consortium holdings of the participating culture collections (see Deliverable D15.15). In the course of this study, spectra of 451 equivalent strains were recorded which were included into the database. The inclusion of synonymous strains deposited in parallel in the participating collections gives an insight into the range of spectra variability of a particular strain. In the second period, the participants accumulated 699 additional spectra of strains of their individual research interests. This strategy resulted in a database of spectra that represent strains of practical relevance for reference and identification purposes and is valuable for the research activities of the participating institutions. Its portfolio makes the database of MALDI-TOF mass spectra of bacteria generated in the course of Subtask JRA2.1.3. attractive also for external users.

6 Significance of this deliverable

MALDI-TOF MS is of great promise for the identification and typing of microbial strains and the most recent literature was provided here.

This collaborative work described in this workpackage provides a set of quality control profiles (1150 profiles from 11 genus) that is publicly available and can be download by scientists for the implementation of this new identification approach.
